

TUTORIAL – SESSION 1

IMPLEMENTATION OF THE VRP PROBLEM (VEHICLE ROUTING PROBLEM)

**SEMINAR:
TÉCNICAS AVANZADAS DE OPTIMIZACIÓN PARA EL SECTOR PETROLERO**

PROMOTORS:

PARTICIPANTS:

Invited Speaker:

Professor Ignacio Grossmann, Ph. D.
Center for Advanced Processes Decision-making (CAPD)
Carnegie Mellon University

Date: February 5th ,2016
Time: 9:00 am a 5:00 pm
Place: Auditorio ITAM, México D.F.
Attend: Personal Invitation

Request of invitation:

Detailed program:

ICORD 2016

DOA invited you to visit <http://ifors.org/icord2016/> and to participate in ICORD 2016 that will be held on June 9-10, 2016 at the facilities of Instituto Tecnológico Autónomo de México (ITAM) in México City.

SPONSORS:

OBJECTIVE

The purpose of this tutorial is oriented to show to the reader, from scratch, step by step, the implementation of an optimization problem using **OPTEX**. This implementation is performed in two steps:

1. Implementation of the model in **OPTEX-EXCEL-MMS**.

- Implement, in an empty template of **OPTEX-EXCEL-MMS**, the mathematical model
- Solve the problem associated with the mathematical model using **OPTEX-WEB**
- Solve the problem associated with the mathematical model using **OPTEX-EXCEL-MMS**

2. Implementation of the model in **OPTEX-MMIS**

- Import the mathematical model from the template in EXCEL to **OPTEX**
- Check the mathematical model using the services offered by **OPTEX-GUI**
- Generate computer programs in C, GAMS and OPL-IBM technologies.
- Load data from the VRP problem in an EXCEL template generated by **OPTEX-GUI**.
- Solve the problem associated with the mathematical model using **OPTEX-EXE**.

To perform the first process, the interested requires to have installed in his computer the components of **OPTEX-EXCEL-MMS**; for the second process is required to have installed a full version of **OPTEX**.

This tutorial is not intended to teach to formulate mathematical models of optimization and therefore not analyzed or discussed the validity of the formulation; the aim is that the user understands the steps to follow to implement a "simple" mathematical model in **OPTEX-EXCEL-MMS** and **OPTEX-MMIS**.

The tutorial document is divided into 13 sections/numerals and the presentation of the tutorial is considered it can be arranged in 8 sessions covering all the numerals, each session is linked to a presentation of "slides" (in English) in which the material is presented, and this presentation is associated with a video (this material will be released when it is available).

TUTORIAL BASIC

- 1. SESSION 1: INTRODUCTION**
 - Introduction to OPTEX (Section 1)
 - OPTEX-EXCEL-MMS (Section 2)
- 2. SESSION 2: VRP MODELING IN EXCEL**
 - VRP: Vehicle Routing Problem (Section 3)
 - Implementing VRP Model using EXCEL (Section 4)
- 3. SESSION 3: USING EXCEL TO LOAD DATA**
 - Industrial Data Information Systems –IDIS- (Section 5)
- 4. SESSION 4: OPTEX-GUI – LOADING MODELS**
 - Loading the Model in OPTEX-MMIS (Section 6)
 - Verification of the Model in OPTEX-MMIS (Section 7)
- 5. SESSION 5: Loading and Checking Industrial Data**
 - Implementation and Validation of IDIS- (Section 8)
- 6. SESSION 6: Solving Mathematical Models**
 - Scenarios and Families of Scenarios (Section 9)
 - Solution of Mathematical Problems (Section 10)
 - Results Information System (Section 11)
- 7. SESSION 7: SQL Servers**
 - Using SQL Servers for IDIS (Section 12)
- 8. SESSION 8: Optimization Technologies**
 - Solving Problems using C (Section 13.1)
 - Solving Problems using GAMS (Section 13.2)
 - Solving Problems using IBM OPL (Section 13.3)

TUTORIAL IMPLEMENTATION OF THE VRP PROBLEM (VEHICLE ROUTING PROBLEM)

CLOUD

OPT Σ X is the result of more than twenty years of experience in multiple optimization projects applied to real life problems, developed in several countries, economical sectors and cultures;

Now **DOA** share the benefits of **OPT Σ X** with the Mathematical Programming Community.

was developed to support real mathematical modeling projects since 1991, now **OPTΣX is a commercial optimization technology supported by **DO ANALYTICS** LLC.**

OPTΣX dramatically simplifies the developing and solving of complex optimization applications by supporting:

- **Rapid Prototyping**
- **Big Data Intensive Optimization**
- **Decision-Making under Uncertainty**
- **Integrate Multiples Languages and Optimization Technologies**
 - **Optimization in the Cloud**
 - **Advanced Optimization using EXCEL Tables**

IS A META-FRAMEWORK (AN EXPERT SYSTEM, A ROBOT)

ORIENTED TOWARDS THE DESIGN, IMPLEMENTATION AND SETUP OF DECISION SUPPORT SYSTEMS BASED ON MATHEMATICAL PROGRAMMING WITH SPECIAL EMPHASIS IN THE DEVELOPMENT OF FINAL USER APPS:

- **ALGEBRAIC FORMULATION IS INDEPENDENT FROM ANY COMPUTER PROGRAMMING LANGUAGE**
 - **CAN BE CONNECTED WITH ANY DATA SERVER**
 - **CAN BE CONNECTED TO ANY VISUALIZATION SYSTEM**

THEREBY GENERATING APPS USING MULTIPLE COMMERCIAL OR NONCOMMERCIAL TECH ACCORDING TO THE CLIENTS' NEEDS

DATABASE ALGEBRAIC LANGUAGE (THE NEW PARADIGM)

CLICK OVER THE IMAGE TO OBTAIN MORE INFORMATION

OPT Σ X sees the implementation of a Decision Support System as a load of a Relational Information System converting the mathematical modeling and the software production in a “filling the blanks” process. The lan-wan environment makes easy the simultaneous work, of several modelers, using the power of internet and the database servers.

MATHEMATICAL MODELS INFORMATION SYSTEM (MMIS)

An information system allows you to manage the data of a set of entities (objects).

An information system of a mathematical model required to define the entities that are part of the algebraic formulation of mathematical problems, these entities are associated with indexes (or sub-indices) which identifies the objects included in the mathematical model.

OPT Σ X assumes that the structure of the information system (data model) follows the principles of the relational information systems (database) which are supported in the so-called relational algebra.

SUGGESTION:

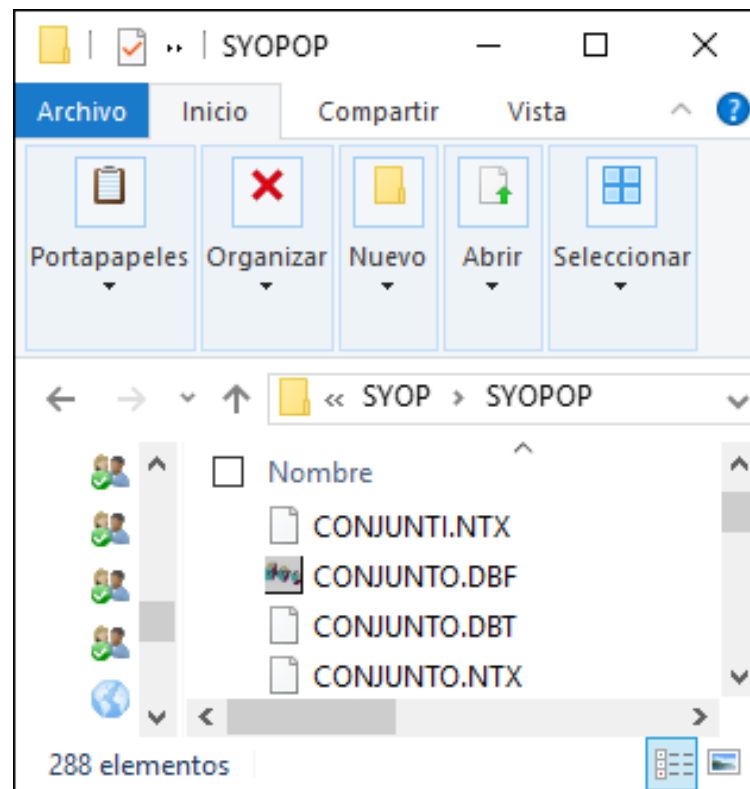

If the reader is not familiar with relational databases, we suggest that read about technical literature and OPT Σ X technical manuals related to the topic, since these information guidelines will help you to manage information systems which access the computer programs to solve mathematical problems:

- http://www.doanalytics.net/Documents/Modelo_Relacional.pdf
- <http://www.doanalytics.net/Documents/Manual-OPTEX-Modelamiento-Sistema-Informacion-IDIS.pdf>
- <http://www.doanalytics.net/Documents/Manual-OPTEX-Administrador-Validacion-Datos.pdf>

MANAGEMENT OF DBASE (DBF) FILES

OPTEX always uses tables in DBF format. This is because that the areas of control of **OPTEX** (MMIS) tables are always handled in DBF. In the case of the areas of application data (**IDIS**), they can be handled DBF tables or servers type SQL acceded using ODBC. It is required to take into account two important aspects in the management of the DBF tables:

- DBT Memo Files:** When tables contain MEMO fields, the managers of DBF databases linked a special table to store the MEMOs called **XXXXX.DBT**, where **XXXXX** is the name of the table containing fields MEMOs. It is important that these two tables (the DBF and the DBT) must be handled jointly; when the DBT table is lost, for any reason, it is possible to lose data stored in DBF table.
- NTX Index Files:** to control the order of access of records in a table, and to facilitate relationships between tables that are linked through common fields, **OPTEX** MMS uses the NTX index files. There may be multiple files NTX, one for each order (index) that you want to have, for a DBF table. The following image presents the case of the table **CONJUNTO.DBF**, you have MEMOs stored in the file **CONJUNTO.DBT** and whose ordering is set from two points of view: **CONJUNTO.NTX** and **CONJUNT1.NTX**.

DATA ORGANIZATION

This topic is important for users to directly use OPTeX installed on their computer.

Prior to the loading of the MMIS and, should be into account the way in which information for the integrated management of all mathematical modeling system should be organized. Under the conception of OPTeX, an information system is composed of multiple databases (group of tables) that are conceived as an information areas and are classified into:

- **Control of Information Systems:** stores the tables corresponding to a data model of an information system. **It is implemented in DBASE tables and it is part of the MMIS.**
- **Control of Mathematical Models:** stores the tables corresponding to the formulation of optimization mathematical models. **It is implemented in DBASE tables and it is part of the MMIS**
- **Business/Industrial Data:** stores the tables corresponding to the data to which the user of the application has access. This area comprises two areas of data: the permanent data of the application, and the data of scenarios of the mathematical models. The user chooses the type of database that wants to handle, may be in DBASE tables or tables in a server type SQL. It corresponds to the so-called IDIS

DATA ORGANIZATION

OPTEX, considers the following areas or data directories:

- **OPTEX-GUI Control Area:** stores the tables of OPTEX-GUI control. It is designed and controlled by DOA;
- **OPTEX-MMIS Control Area:** stores the MMIS control tables. It is designed and controlled by DOA;
- **IDIS Control Area:** stores the IDIS control tables. This area controls all the areas in which subdivides the IDIS. It is configured by the OPTEX-GUI administrator;
- **Mathematical Models (MMIS) Data Area:** stores data that define mathematical optimization models. It must be configured by the administrator/modeler of OPTEX-MMIS;
- **IDIS Data Area:** stores permanent IDIS data, it must be maintained by the IDIS users and is controlled by IDIS Control Area;
- **Scenarios Family Data Area:** stores data that are common to a family of scenarios, it must be maintained by the IDIS users and is controlled by the IDIS Control Area. Data from the family of scenarios is located from the area (root) scenarios (which is defined in the table of parameterization of applications as described in the Manual OPTEX-GUI Administrator). An area corresponds to each scenario family.
- **Scenarios Data Area:** stores data specific to a scenario, it must be maintained by IDIS users, receives data from the solution of models, and is controlled by the IDIS Control Area. In this area OPTEX stored data related to the algebraic and matrix/vectors structures of mathematical models and several reports. Scenarios data area is located under the directory associated with the family of scenarios. Each scenario has an area.

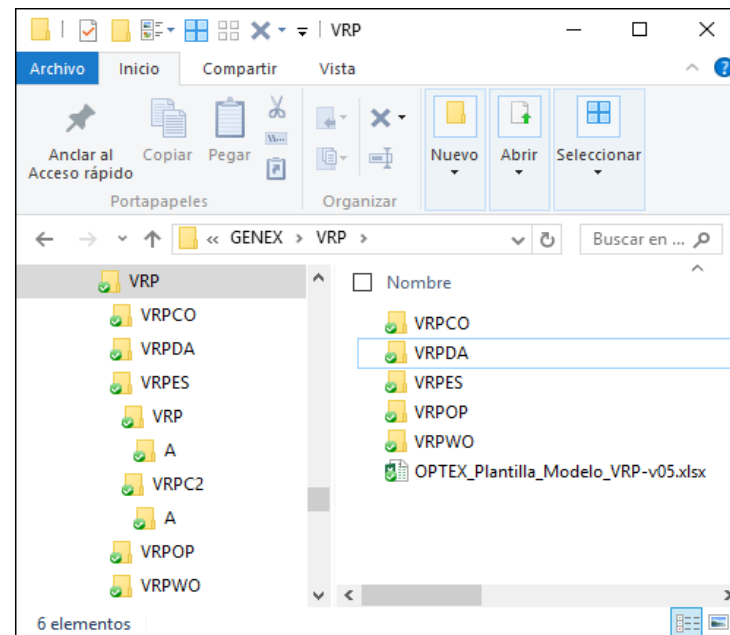

DATA ORGANIZATION

AREAS OF INFORMATION SYSTEM		
AREA	DBF TABLES DIRECTORY	SQL TABLES PREFIX
Control OPTEX-GUI	C:/OPTEX/OPTEX	(0)
Control OPTEX-MMIS	C:/OPTEX/OPTEX	(0)
Control IDIS DATA MODEL	C:/OPTEX/aaa/aaaCO ⁽¹⁾	(0)
Control Mathematical Models (MMIS)	C:/OPTEX/aaa/aaaOP ⁽¹⁾	(0)
IDIS	C:/OPTEX/aaa/aaaDA ⁽¹⁾	(2)
ROOT OF THE FAMILY OF SCENARIOS	C:/OPTEX/aaa/aaaES/fff ⁽¹⁾	fff_ ⁽¹⁾
ESCENARIOS DE LA FAMILIA	C:/OPTEX/aaa/aaaES/fff/eee ⁽¹⁾	fff_eee_ ⁽¹⁾

Nota:
(0) DBF tables
(1) **aaa** is associated with the application, **fff** with the family of scenarios and **eee** with the scenario
(2) **SQL** tables without prefix

The image shows the directories associated with the data areas of the OPTEX application.

Clarifies that directories can be arranged in any way, the choice in this case is to place them all in the same directory where the directory name (**VRP**) is a mnemonic that acts as a prefix in all directories.

With **OPTEX-EXCEL-MMS** the mathematical modelers can formulate multi model decision support systems, with no knowledge about computer technologies, also can generate complex models in several algebraic computer languages linked to any data server that supports ODBCs connections.

DATA MODEL

ALGEBRAIC MODEL

$$\text{Min } \Psi = \sum_{t=1}^T \sum_{i=1}^{N_t} \Psi_{(i,t)}$$

s.a.

$$\Psi_{(i,t)} = \frac{c_{(i,t)}}{2} \cdot P_{(i,t)}^2 + e_{(i,t)} \cdot P_{(i,t)}$$

$$V_{(j,t+1)} = V_{(j,t)} + \tau \cdot (A_{(j,t)} - Q_{(j,t)} - S_{(j,t)})$$

$$P_{(j,t)} = \rho_{(j)} \cdot Q_{(j,t)}$$

OPTeX WEB SERVICE

OPTeX-WEB is a web-oriented interface to access services provided by OPTeX, facilitating the OPTeX-EXEL-MMS user sending a request of process to solve a mathematical model in an OPTeX OPTIMIZATION SERVER.

To use this service, the user only requires having mathematical models on the **OPTeX-EXCEL-MMS** template and data in CSV files or an EXCEL template generated by OPTeX. **It does not require installation of OPTeX.**

The screenshot shows the OPTeX Optimization Server web interface. The page title is "OPTIMIZATION SERVER" and it is powered by OPTeX Mathematical Modeling System. The interface is divided into several sections for configuring the optimization process:

- Output File:** GAMS
- Library:** CPLEX
- LP Algorithm:** Default
- Feasibility:** NO Relajacion
- Objective F:** Activa
- Emphasis:** Optimalidad+Facilit
- Checkboxes:**
 - Load, check model
 - Load data
 - Check data
 - Execute Model
 - Deterministic Mode
 - Tuning
 - Parallel Optimization
 - Parallel Problems
 - Filter Results
 - Detail Log
- Parametric Optimization:** Regular optimizatic
- Cores Solver:** Default
- Output Language:** English
- Entities Tables:**
 - GIS Tables
 - GANTT Tables
 - EXCEL-GUI
 - EXCEL-Tables
 - EXCEL Book
 - OLAP Cubes
 - Tableau
 - QLIK View
 - XML File
 - MPS File
- Inputs File:** Examinar...
- Model File:** Examinar...
- Server:** DW Server 16 Con
- IP:** 4.31.168.188
- Connections:** 120
- Process:** 1800
- Socket:** 5000
- Action:** Solver Remote
- User:** optexmms
- Password:** [Redacted]

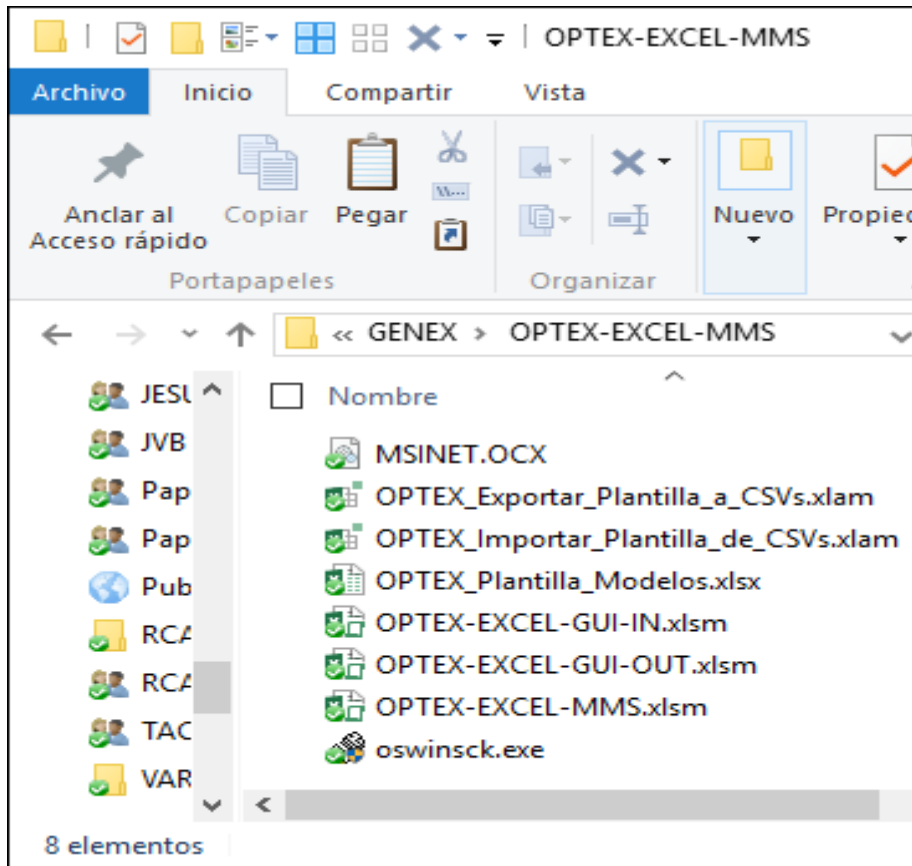

At the bottom right, there are "Send" and "Clear" buttons.

OPTEX-EXCEL-GUI

All the results of mathematical models can be visualized and analyzed using **OPTEX-EXCEL-GUI**, which corresponds to a graphical interface in EXCEL, based on dynamic graphs and dynamic tables. The interested reader can consult the **OPTEX-EXCEL-GUI User Manual**.

EXCEL COMPONENTS

To access **OPTEX-EXCEL Mathematical Modeling System (OPTEX-EXCEL-MMS)** the user only requires to get the components that are part of this product that are:

<http://www.doanalytics.net/OPTEX/Download/OPTEX-EXCEL-MMS.ar>

The services offered by **OPTEX-EXCEL-MMS** are:

- **EXCEL** add-ins to connect to **OPTEX**
- **OPTEX** template for implementation of mathematical models using **EXCEL**
- Conversion of **EXCEL** templates to **CSV** files (**Comma Separated Values**) and vice versa.
- Access to **OPTEX-OPTIMIZATION SERVER** located in a **DO ANALYTICS** cloud server, to solve mathematical problems
- Visualization of results using **OPTEX-EXCEL-GUI**.

"the computer-based mathematical modeling is the greatest invention of all times"

**Herbert Simon
First Winner of Nobel Prize in Economics (1978)**

"for his pioneering research into the decision-making process within economic organizations"
